2023-11-05

*#1 Using the for loop, create an R script that will display a 5x5 matrix as shown in Figure 1. It must*

```
vecZero <- c(0,0,0,0,0)
matZero <- matrix(vecZero, 5, 5)
```

```
matZero
```

```
##      [,1] [,2] [,3] [,4] [,5]
## [1,]    0    0    0    0    0
## [2,]    0    0    0    0    0
## [3,]    0    0    0    0    0
## [4,]    0    0    0    0    0
## [5,]    0    0    0    0    0
```

```
vectorA <- c(1,2,3,4,5)
matVecA <- matrix(vectorA, 5, 5)
```

```
for (i in 1:length(vectorA)) {
  matZero[i, ] <- abs(vectorA - vectorA[i] )
}
```

```
print(matZero)
```

```
##      [,1] [,2] [,3] [,4] [,5]
## [1,]    0    1    2    3    4
## [2,]    1    0    1    2    3
## [3,]    2    1    0    1    2
## [4,]    3    2    1    0    1
## [5,]    4    3    2    1    0
```

*#2 Print the string "\*" using for() function. The output should be the same as shown in Figure*

```
star <- "*"
```

```
for (i in 1:5) {
  starnew <- rep(star, i)
  print(starnew)
}
```

```
## [1] "*"
## [1] "*" "*"
## [1] "*" "*" "*"
## [1] "*" "*" "*" "*"
```

```
## [1] "*" "*" "*" "*" "*"
```

*#3 Get an input from the user to print the Fibonacci sequence starting from the 1st input up to 500. Use*

```
readlineInput <- as.integer(readline("Enter the starting Fibonacci sequence number: "))
```

```
## Enter the starting Fibonacci sequence number:
```

```
if(is.na(readlineInput || readlineInput < 0)) {  
  cat("Error: Enter a number!")  
} else {
```

```
  userinput <- readlineInput  
  a <- userinput  
  b <- 0
```

```
  cat("Fibonacci sequence starting from", userinput, ":\n")
```

```
  repeat {  
    next_num <- a + b  
    if (next_num > 500){  
      cat("STOPPED!!! next sequence will be over 500")  
      break  
    }  
    cat(next_num, " ")  
    a <- b  
    b <- next_num  
  }  
  
  cat("\n")  
}
```

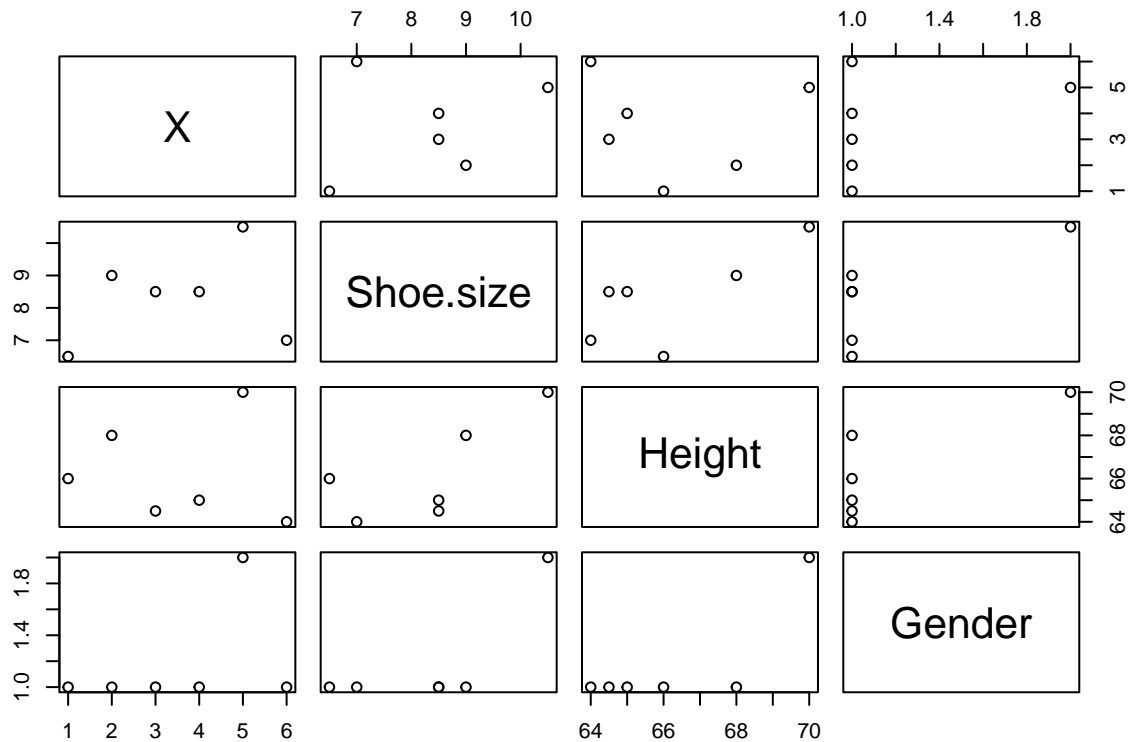

```
## Error: Enter a number!
```

*#4 Import the dataset as shown in Figure 1 you have created previously.*

*#4a What is the R script for importing an excel or a csv file? Display the first 6 rows of the dataset?*

```
imp <- read.csv("prevdata")
```

```
plot(head(imp,6))
```

*#4b Create a subset for gender(female and male). How many observations are there in Male? How about in .*

```
numofFem <- subset(imp, Gender == "F")
numofMale <- subset(imp, Gender == "M")
```

```
numofFem <- nrow(numofFem)
numofMale <- nrow(numofMale)
```

```
cat("Number of observations in Female subset: ", numofFem, "\n")
```

```
## Number of observations in Female subset: 14
```

```
barplot(table(subset(numofFem, imp$Gender == "F" )), main = "Female Shoe Size")
```

## Female Shoe Size

14

```
cat("Number of observations in Male subset: ", numofMale, "\n")
```

```
## Number of observations in Male subset: 14
```

```
barplot(table(subset(numofMale, imp$Gender == "F")), main = "Male Shoe Size")
```

## Male Shoe Size

14

```
#4c Create a graph for the number of males and females for Household Data. Use plot(), chart type = bar
```

```
totalofMF <- table(imp$Gender)
```

```
barplot(totalofMF,
  main = "Number of Males and Females",
  xlab = "Gender",

     title = "Species")
```

```
#6f Interpret the result
```

```
#In This Iris dataset helps us see how iris flowers of different species are different in terms of sepa
```

```
# -Setosa: These flowers typically have short sepal length and wide sepal width. They are grouped in th
```

```
# -Versicolor: Versicolor flowers have average sepal length and width. They are in the middle part.
```

```
# - Virginica: Virginica flowers are usually long in sepal length and have narrower sepal width. They f
```

```
#This plot makes it easy to see the differences between the three iris species based on sepal length an
```

7.Import the alexa-file.xlsx. Check on the variations. Notice that there are ex-tra whitespaces among black variants (Black Dot, Black Plus, Black Show, Black Spot). Also on the white variants (White Dot, White Plus, White Show, White Spot).

```
library(readxl)
alexa_file <- read_excel("alexa_file.xlsx")
```

7 a. Rename the white and black variants by using gsub() function.

```
alexa_file$variation <- gsub("Black Dot" , "BlackDot", alexa_file$variation)
alexa_file$variation <- gsub("Black Plus" , "BlackPlus", alexa_file$variation )
alexa_file$variation <- gsub("Black Show" , "BlackShow", alexa_file$variation )
alexa_file$variation <- gsub("Black Spot" , "BlackSpot", alexa_file$variation )

alexa_file$variation <- gsub("White Dot" , "WhiteDot", alexa_file$variation )
alexa_file$variation <- gsub("White Plus" , "WhitePlus", alexa_file$variation )
alexa_file$variation <- gsub("White Show" , "WhiteShow", alexa_file$variation )
alexa_file$variation <- gsub("White Spot" , "WhiteSpot", alexa_file$variation )
```

7b. Get the total number of each variations and save it into another object. Save the object as variations.RData. Write the R scripts. What is its result? Hint: Use the dplyr package. Make sure to install it before loading the package.

```
library(dplyr)

##
## Attaching package: 'dplyr'

## The following objects are masked from 'package:stats':
##
##   filter, lag

## The following objects are masked from 'package:base':
##
##   intersect, setdiff, setequal, union

Variationsofalexa <- sort(alexa_file$variation)
Vardata <- alexa_file$variation

Variations.RData <- alexa_file %>%
  count(alexa_file$variation)
```

7.c From the variations.RData, create a barplot(). Complete the details of the chart which include the title, color, labels of each bar.

```
totalofeachVar <- Variations.RData$n
nameOfVar <- Variations.RData$`alexa_file$variation`

varPlot <- barplot(totalofeachVar,
  names.arg = nameOfVar,
  main = "Total number of each variations",
  xlab = "Name of Variations",
  ylab = "Total of each Variatons",
  col = 1:16,
  las = 2,
  space = 2)
```

7.d. Create a `barplot()` for the black and white variations. Plot it in 1 frame, side by side. Complete the details of the chart.

```
library(RColorBrewer)
```

```
par(mfrow = c(1,2))
```

```
blackPlot <- barplot(height = c(261,270,265,241,516),
```

```
names.arg = c("Black","Black Plus","Black Show","Black Spot","Black Dot"), main =
```

```
col = 1:5,
```

```
xlab = "Variation",
```

```
ylab = "Count")
```

```
whitePlot <- barplot(height = c(91,184,78,85,109),
```

```
names.arg = c("White", "White Dot", "White Plus", "White Show", "White Spot"),
```

```
main = "White Variations",
```

```
col = 6:10,
```

```
xlab = "Variation",
```

```
ylab = "Count",)
```

```
png("whitePlot")  
png("blackPlot.png")
```
